

Programming Assignment #7

Learning objective : You are to gain experience using a single class to implement a solution to more than one problem and experience modifying a class that implements a data structure.

Exercise 1

Write a main program called *palindrome.cpp*. This program will accept as input a single group of character and your output will be a single answer, either the string is a palindrome or not a palindrome. A palindrome is a word or string of characters that is spelled the same backward or forward.

Write a program that uses a stack object to determine if a string is a palindrome (i.e. the string is spelled identically backward and forward). The program should ignore spaces and punctuation.

Go ahead and start your program by reading in a C-style string from standard input, using the `getline` function. You may assume a limit of 100 characters on the string (although this can be written, with a little more effort, to accept any size string). Your algorithm must make use of a stack (of type `char`). Use the Deitel implementation of the Stack from "stack.h" (you **don't** need to change this file).

Your program should examine only the letters in the character string input and ignore spaces and any special characters. Additionally your program must ignore the case of a letter. The letter 'a' is the same as 'A'. See the examples below.

Sample runs: (user input underlined)

```
Please enter a string:
```

```
> ABCDEFGHGFEDCBA
```

```
"ABCDEFGHGFEDCBA" IS a palindrome
```

```
Please enter a string:
```

```
> The quick brown fox
```

```
"The quick brown fox" is NOT palindrome
```

```
Please enter a string:
```

```
> Cigar? Toss it in a can. It is so tragic.
```

```
"Cigar? Toss it in a can. It is so tragic." IS a palindrome\
```

Want some palindromes to test you can visit the site www.palindrome.com.

Implementation Details:

- If the user enters a string of characters that contain spaces or special characters you need to ignore those characters when evaluating the string as a palindrome.

COP3330 Object Oriented Programming in C/C++

- You need to ignore the case (upper or lower case) which means that you should change the input string to either upper or lower case letters.
 - Since you are reading data into a C-style string to begin, you may use any of the libraries `<iostream>`, `<cstring>`, and `<cctype>`, if you like. (The first, of course, for I/O, and the other two, since they deal with C-style strings and characters).
-

Exercise 2

Modify the List class (file `list.h` so that it has two more functions, which will allow inserts and removes from anywhere in the linked list. Your functions should be called:

- `insertMiddle`
- `removeMiddle`

Your functions should have all the same features as the given `insert` and `remove` functions, except that yours each have one extra parameter. The second parameter on each of your functions should be of type `int`, representing the **position** at which to insert (or delete). Sample calls for a list of integers:

```
L.insertMiddle(345, 5);      // attempts to insert the value 345
                             // as the 5th item in the list.

L.removeMiddle(x, 10);       // attempts to delete the 10th item in the
                             // list and captures its value into x.
```

For `insertMiddle`, if the position number is larger than the number of items in the list, just insert the item at the **back**. If it's too small (i.e. 0 or less), insert at the **front**. For `removeMiddle`, return false if the position is invalid (without removing anything).

I've modified the menu program of Figure 21.5 so that it adds in two more menu options for testing these features. You can use it to test your class: [menu7.cpp](#)

Submitting:

Submit Files `palindrom.cpp` and `list.h`

```
